RouterBOARD, RouterOS, RouterBOOT and MikroTik are trademarks of MikroTikls SIA. All trademarks and registered trademarks appearing in this manual are the property of their respective holders.

## Limited Warranty

**Copyright and Trademarks**. Copyright MikroTikls SIA. This manual contains information protected by copyright law. No part of it may be reproduced or transmitted in any form without prior written permission from the copyright holder. RouterBOARD, RouterOS, RouterBOOT and MikroTik are trademarks of MikroTikls SIA. All trademarks and registered trademarks appearing in this manual are the property of their respective holders.

**Hardware**. MikroTik warrants all RouterBOARD series equipment for the term of fifteen (15) months from the shipping date to be free of defects in materials and workmanship under normal use and service, except in case of damage caused by mechanical, electrical or other accidental or intended damages caused by improper use or due to wind, rain, fire or other acts of nature.

To return failed units to MikroTik, you must perform the following RMA (Return Merchandise Authorization) procedure. Follow the instructions below to save time, efforts, avoid costs, and improve the speed of the RMA process.

1.If you have purchased your product from a MikroTik Reseller, please contact the Reseller company regarding all warranty and repair issues, the following instructions apply ONLY if you purchased your equipment directly from MikroTik in Latvia.

2. We do not offer repairs for products that are not covered by warranty. Exceptions can be made for RB1000.

3. Out-of-warranty devices and devices not covered by warranty sent to Mikrotikls will be returned to the sender at sender's cost.

Instructions are located on our webpage here: **http://rma.mikrotik.com**

**Manual**. # Specifications

|  | **RouterBOARD 411AR** |
|---|---|
| **CPU** | MIPS24k based, Atheros AR7130 300MHz CPU |
| **Memory** | **64**MB SDRAM onboard memory |
| **Boot loader** | RouterBOOT |
| **Data storage** | 64MB onboard NAND memory chip |
| **Ethernet** | **One** 10/100 Mbit/s Fast Ethernet port supporting Auto-MDI/X |
| **Wireless** | One built-in wireless card AR2417 802.11b/g wireless device |
| **MiniPCI slot** | **One**  free MiniPCI Type IIIA/IIIB slot |
| **Serial port** | One DB9 RS232C asynchronous serial port |
| **LEDs** | Power and User LED, 5 status LEDs |
| **Speaker** | Mini PC-Speaker |
| **Power options** | Power over Ethernet: 10..28V DC (except power over datalines)<br>Power jack: 10..28V DC |
| **Dimensions** | 105mm x 105mm |
| **Weight** | 82 g (2.9 oz) |
| **Temperature** | Operational: -20°C to +65°C (-4°F to 149°F) |
| **Humidity** | Operational: up to 70% relative humidity (non-condensing) |
| **Power consumption** | 3-4W without extension cards, maximum – 12W |

# Hardware Guide

## Memory and Storage Devices

### Onboard Memory

The board is equipped with 64 MB DDR onboard memory.

### Onboard NAND Storage Device

The boards are equipped with one 64MB NAND nonvolatile memory chip.

## Extension Slots

### MiniPCI Slots

The board has one MiniPCI Type IIIA slot with 3.3V only power signaling. It also accepts MiniPCI Type IIIB standard cards. The board has been tested to operate with high power cards if ambient temperature and adequate cooling is ensured.

**NOTE:** that RB400 series currently does not support Senao 8602 cards, Atheros AR5211 or older chipset and Prism chipset based cards. Wireless compression is not supported on RB400 series devices.

Supplied power for the extension cards (excluding CPU and onboard Ethernet ports):

+3.3V: 3.3A max

## Input/Output Ports

### LAN1 Port with PoE

This Fast Ethernet port is recognized as the first LAN interface. It is compatible with passive (non-standard) Power over Ethernet. The board accepts voltage input from 12 to 28 V DC. It is suggested to use higher voltages for power over long cables because of better efficiency (less power is lost in the cable itself and

power supply is more efficient).

See **Connector Index** for pinout of the standard cable required for PoE. All cables made to EIA/TIA 568A/B cable specifications will work correctly with PoE. Note that this port supports automatic cross/straight cable correction (Auto MDI/X), so you can use either straight or cross-over cable for connecting to other devices.

### Onboard 802.11b/g wireless card

This RouterBOARD model has a built-in 802.11b/g wireless device based on the AR2417 Atheros chipset.

MMCX antenna connector is located to the left of the card, as seen in the diagram of page 3.

| RX sensitivity | **802.11g**: –87 dBm @ 6Mbps to -69 dBm @ 54 Mbps |
| | **802.11b**: –92 dBm @ 1Mbps to –83 dBm @ 11 Mbps |
| TX power | Up to 20 dBm |
| Modulations | **802.11g**: OFDM,64QAM,16QAM,QPSK,BPSK |
| | **802.11b**: CCK,DSS,DQPSK, DBPSK |

### DB9 Serial Port

The RS232C standard male DB9 asynchronous serial port may be used for initial configuration, or for attaching a modem or any other RS232 serial device. TxD (pin 3) of this port has -5V DC power when idle. RTS and DTR signals are not connected. **Note** that the device does not fully implement the hardware (RTS/CTS) flow control, so it is suggested to try to disable hardware flow control in the terminal emulation program in case the serial console does not work as expected, and if it does not help, make a new cable using the pinout given in the User's manual.

### LEDs

### Power LED

Power LED is on when the board is powered.

### User LED

User LED may be programmed at user's option. It is lit by default when the board starts up, then it is turned off when the bootloader runs kernel.

### Status LEDs

Six LEDs (LD 501-506) are located to the right of the Serial port. Their functions are as follows:

- LED 1-5 are all user programmable
- LED 4 when not programmed shows Bootloader activity
- LED 5 when not programmed shows NAND activity
- LED 6 is used for Wireless activity (not active in current RouterOS versions)

# User's Guide

## Assembling the Hardware

First to use the board:

- Insert MiniPCI card and connect antenna wires, if needed;
- Install the board in a case;
- Connect other peripherals and cables.

### Powering

Power options:

- **J801** power jack:
  10..28V DC (supports overvoltage protection)

- Power over Ethernet (PoE) on the **J602** LAN1 Ethernet port:
  10..28V DC (18..28 V suggested) non-standard PoE powering support

The board has a direct-input power jack **J801** (5.5mm outside and 2mm inside diameter, female, pin positive plug) and can as well be powered with PoE. All power inputs are always active, but only one should be used at the same time.

RouterBOARD 411AR is equipped with a reliable 14W onboard power supply with overvoltage protection. 9..28 V DC input voltages are accepted, but when powered over long cables, it is suggested to use at least 18V. The system is tested with 24V solar/wind/RV systems with 27.6 charge voltage. Overvoltage protection starts from about 28V (up to 100V), so the board will not be damaged if connected to a 48V or 60V power line.

RouterBOARD 411AR series boards are compatible with non-standard (passive) Power over Ethernet injectors (except power over datalines) and accept powering over up to 100m (330 ft) long Ethernet cable connected to the Ethernet port (**J602**). The board **does not** work with IEEE802.3af compliant 48V power injectors.

The maximum output of the power supply to the extension cards is normally at about 3.3A

## Booting options

First, RouterBOOT loader is started. It displays some useful information on the onboard RS232C asynchronous serial port, which is set to 115200bit/s, 8 data bits, 1 stop bit, no parity by default. The loader may be configured to boot the system from the onboard NAND module or from Ethernet network. See the respective section of this manual for how to configure booting sequence and other boot loader parameters.

### Onboard NAND Storage Device

The RouterBOARD may be started from the onboard NAND storage chip. As there is no partition table on the device, the boot loader assumes the first 4MiB form a YAFFS filesystem, and executes the file called "kernel" stored in the root directory on that partition.

### Booting from network

Network boot works similarly to PXE or EtherBoot protocol, and allows you to boot a RouterBOARD 411 series computer from an executable image stored on a TFTP server. It uses BOOTP or DHCP (configurable in boot loader) protocol to get a valid IP address, and TFTP protocol to download an executable (ELF) kernel image combined with the initial RAM disk (inserted as an ELF section) to boot from (the TFTP server's IP address and the image name must be sent by the BOOTP/DHCP server).

To boot the RouterBOARD computer from Ethernet network you need the following:

- An ELF kernel image for the loader to boot from (you can embed the kernel parameters and initrd image as ELF sections called *kernparm* and *initrd* respectively)

- A TFTP server which to download the image from

- A BOOTP/DHCP server (may be installed on the same machine as the TFTP server) to give an IP address, TFTP server address and boot image name

See the RouterBOOT section on how to configure loader to boot from network.

Note that you must connect the RouterBOARD you want to boot, and the BOOTP/DHCP and TFTP servers to the same broadcast domain (i.e., there must not be any routers between them).

## RouterBOOT

The RouterBOOT firmware (also referred as "boot loader" here) provides minimal functionality to boot an Operating System. It supports serial console via the onboard serial port at the boot time. The loader supports booting from the onboard NAND device and from a network server (see the respective section for details on this protocol).

# Boot Loader Configuration

Loader parameters may be configured through the onboard RS232C DB9 asynchronous serial interface. To connect to it, use a standard null-modem cable. By default, the port is set to 115200bit/s, 8 data bits, 1 stop bit, no parity. **Note** that the device does not fully implement the hardware (RTS/CTS) flow control, so it is suggested to try to disable hardware flow control in the terminal emulation program in case the serial console does not work as expected, and if it does not help, make a new cable using the pinout given in the Appendix.

To enter the loader configuration screen, press any key (or only [Delete] key (or [Backspace] key – see the note for the respective configurable option), depending on the actual configuration) just after the loader is asking for it:

```
RouterBOOT booter 2.12

RouterBoard 411

CPU frequency: 300 MHz
  Memory size:  32 MB

Press any key within 2 seconds to enter setup

RouterBOOT-2.12
What do you want to configure?
   d - boot delay
   k - boot key
   s - serial console
   o - boot device
   u - cpu mode
   r - reset configuration
   e - format nand
   g - upgrade firmware
   i - board info
   p - boot protocol
   t - do memory testing
   x - exit setup
your choice:
```

To select a menu point, press the indicated key. Pressing [Enter] selects the option marked with '*'.

## Configurable Options

**boot delay** – how much time to wait for a key stroke while booting (1..9 seconds; **2 second** by default).

**boot key** – which key will cause the loader to enter configuration mode during **boot delay** (any key | <Delete> key only; **any key** by default). Note that in some serial terminal programs, it is impossible to use the [Delete] key to enter the setup – in this case it might be possible to do this with the [Backspace] key.

**serial console** – to configure initial serial console bitrate (1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600 | 115200; **115200** bps by default).

**boot device** – initial boot device (boot over Ethernet | boot from NAND | boot Ethernet once, then NAND; **boot from NAND** by default). You can also select **boot chosen device** option to boot from the device selected immediately, without saving the setting.

**cpu mode** – whether to enter CPU suspend mode on WAIT instruction (power save | regular; **power save** by default). Most OSs use WAIT instruction during CPU idle cycle. When CPU is in suspend mode, it consumes less power, but in low-temperature conditions (below 0°C) it is recommended to choose regular mode, so that overall system temperature would be higher.

**reset configuration** – whether to reset all the boot loader settings to their respective default values (yes | no; **no** by default).

**format nand** – perform a low-level NAND format. During this operation, all previously marked bad sectors are retested to find out if they are faulty indeed.

**upgrade firmware** – receive a new boot loader image using XModem protocol over serial line or using DHCP/BOOTP and TFTP protocols through the Ethernet network (upgrade firmware over ethernet | upgrade firmware over serial port).

**board info** – prints the serial number, boot loader version, CPU frequency, memory size and MAC addresses of the onboard Ethernet ports

**boot protocol** – network booting protocol (bootp protocol | dhcp protocol; **bootp protocol** by default).

**do memory testing** – performs a full memory test.

## Boot Loader Upgrading

The boot loader is needed to initialize all the hardware and boot the system up. Newer loader versions might have support for more hardware, so it's generally a good idea to upgrade the loader once a newer version is available. You can upgrade the loader through the onboard serial port using XModem protocol (programs available for all major OSs). For example, you can use HyperTerminal for Windows or Minicom for Linux to upload the boot loader. Alternatively if you have a DHCP/BOOTP and TFTP servers available, you can specify the loader image as a boot image and choose the **bios upgrade over ethernet** option in the boot loader configuration menu. The loader will get the image from the TFTP server and upgrade itself. The most current loader image is available for download on www.routerboard.com.

The boot loader upgrading is supported also from MikroTik RouterOS. The procedure is described in the MikroTik RouterOS manual.

## Serial Null-modem (Console) Cable with Loopback

| DB9f | Function | DB9f | DB25f |
|---|---|---|---|
| 1 + 4 + 6 | CD + DTR + DSR | N/C | N/C |
| N/C | CD + DTR + DSR | 1 + 4 + 6 | 6 + 8 + 20 |
| 2 | RxD | 3 | 2 |
| 3 | TxD | 2 | 3 |
| 5 | GND | 5 | 7 |
| 7 + 8 | RTS + CTS | N/C | N/C |
| N/C | RTS + CTS | 7 + 8 | 4 + 5 |

## Connector Index
